

3 a) transmitting a data packet from said one unit to said base station  
4 during a first time period selected by the unit;

5 b) receiving at said one unit from said base station a reply signal during  
6 a second time period occurring only during a selected time window after said first  
time period, said second time period being the same for at least some of said units.--

1 <sup>2</sup>  
~~26.~~ A method according to claim <sup>1</sup>~~25~~ wherein said steps of transmitting and  
receiving are by spread spectrum RF signals.

1 <sup>3</sup>  
~~27.~~ A method according to claim <sup>1</sup>~~25~~ wherein said remote terminal unit is one  
of a plurality of remote stations associated with the transmitter of said reply signal.

1 <sup>4</sup>  
~~28.~~ A method according to claim <sup>3</sup>~~27~~ wherein said remote stations are hand-  
2 held data-gathering units which include manual control elements, and wherein at least  
some of said remote stations include bar-code reading devices.

1 <sup>5</sup>  
~~29.~~ A method according to claim <sup>1</sup>~~25~~ wherein said reply signal is transmitted  
2 by a second station which is one of a plurality of said second stations physically  
3 spaced from one another, and there are a plurality of said remote terminal units for  
each said second station.

1 <sup>6</sup>  
~~30.~~ A method according to claim <sup>1</sup>~~25~~ including the step of listening at said unit  
2 prior to said step of transmitting said data packet to see if other like units are  
transmitting.

1 <sup>7</sup>  
~~31.~~ A system for transmitting data packets from one of a plurality of first  
2 stations to a second station, comprising:

Filed: January 18, 1994

3 a) a transmitter in said one first station for transmitting a data packet  
4 from said one first station to the second station during a first time period selected by  
5 said one first station;

6 b) a receiver in said one first station for receiving a reply signal from  
7 the second station during a second time period occurring only in a time window  
8 referenced to said first time period by a selected delay, said selected delay being the  
9 same for all said plurality of first stations.

10 <sup>8</sup> ~~32~~. A system according to claim <sup>7</sup> ~~31~~ wherein said transmitter and receiver  
employ spread spectrum RF signals.

1 <sup>9</sup> ~~33~~. A system according to claim <sup>7</sup> ~~31~~ wherein said first station is one of a  
plurality of remote stations associated with a transmitter of said reply signal.

1 <sup>10</sup> ~~34~~. A system according to claim <sup>9</sup> ~~33~~ wherein said remote stations are hand-  
2 held data-gathering units which include manual control elements, and wherein at least  
some of said remote stations include bar-code reading devices.

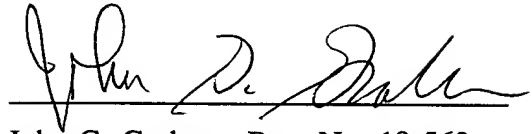

1 <sup>11</sup> ~~35~~. A system according to claim <sup>7</sup> ~~31~~ wherein said reply signal is transmitted  
2 by a second station which is one of a plurality of said second stations physically  
3 spaced from one another, and there are a plurality of said first stations for each said  
second station.

1 <sup>12</sup> ~~36~~. A method according to claim <sup>7</sup> ~~31~~ including means for listening at said first  
2 station prior to said transmitting said data packet to see if other like units are  
transmitting.
